KRE8ΩR

MASTER SYSTEM BIBLE

The complete technical blueprint for the world's first AI-native solo creator production OS

---

7 Kin Homestead · Version 1.0 · March 2026

SINE RESISTENTIA — Create without limits. Distribute without resistance.

WHAT THIS DOCUMENT IS

This is the founding artifact of the Kre8Ωr system. Every pipeline stage, every integration, every approval gate, every data flow, every build decision, and every future product consideration lives here. A developer, a Claude Code session, or a new collaborator should be able to pick this up and build any part of the system without asking a single clarifying question.

HOW TO USE IT

Read Section 1 to understand the philosophy — it shapes every technical decision. Read Section 2 for the org chart and module map. Sections 3–10 go deep on each C-Suite module. Section 11 covers the database and data flow. Section 12 is the build order. Section 13 is the commercial layer. The appendix has the full integration reference.

SECTION 1 — SYSTEM PHILOSOPHY

The One Problem This Solves

The creator of 7 Kin Homestead has 725k TikTok followers, 54k YouTube subscribers, 80k Lemon8 followers, and a paid Kajabi community called ROCK RICH. They produce high-quality content about off-grid living, homesteading, financial independence, and self-sufficient living.

Their problem is not ideas. It is not talent. It is not audience. It is the crushing administrative, organizational, and technical layer that sits between having an idea and that idea reaching an audience. Scripts that don't get written. Footage that doesn't get organized. Edits that take days. Captions that are an afterthought. Emails that never get sent.

Kre8Ωr exists to eliminate that layer entirely.

> **THE PRIME DIRECTIVE**
> Every feature, every automation, every approval gate must be measured against one question: does this reduce the number of decisions the creator has to make, or does it add one? If it adds one — redesign it.

The Three Laws

- **Law 1: The creator approves, never executes. The system does the work. The creator chooses between options or confirms the system's choices.**
- **Law 2: Every pipeline stage has a defined input, a defined output, and a defined handoff point. Nothing is ambiguous. Nothing falls through a gap.**
- **Law 3: The system is restartable at any stage. If a shoot happens Monday and distribution happens Friday, the system picks up exactly where it left off with full context intact.**

The Creator's Role — Three Moments Only

In the fully realized system, the creator participates in exactly three types of moments:

MOMENT 1: IDEATION

What to make. Topic direction, creative angle, what story to tell. The system brings research, the creator brings vision.

MOMENT 2: THE SHOOT

Being on camera. Being real. Being themselves. The system handles everything

> **EVERYTHING ELSE**
> Research. Shot lists. Footage organization. Tra
> Rough cut assembly. Music selection. Email se
> Analytics. Archive management. All of it handle

before and after. The creator just shows up and performs.

MOMENT 3: FINAL REVIEW

Is this me? Is this ready? Three approval gates. The system assembled everything. The creator confirms it's authentic.

The Engine vs The Soul

Every technical decision in this system must respect one architectural principle that enables the commercial future of this product:

> **SEPARATE THE ENGINE FROM THE SOUL**
>
> Engine: pipeline logic, automation scripts, database schema, API integrations, module code. Lives in the codebase. Niche-agnostic. Reusable by any creator. Soul: voice profile, community details, platform credentials, personality config, brand settings. Lives in creator-profile.json. Swappable in minutes. The difference between a personal tool and a SaaS product is one config file. We build that way from day one.

SECTION 2 — THE KRE8ΩR ORG CHART

The C-Suite

Kre8Ωr is the CEO — the master orchestration layer that all modules report to. Each C-Suite module owns a distinct phase of the production pipeline. They communicate through a shared SQLite database and a central pipeline state manager.

Module	Title	Owns
Kre8Ωr	CEO / Master System	Orchestration, pipeline state, creator dashboard, all module coordination
Id8Ωr	Chief Ideas Officer	Ideation, scripting, VidIQ research, pre-production planning
DirectΩr	Chief Production Officer	Shoot day management, shot lists, coverage checklists, team prompts
EditΩr	Chief Post-Production Officer	Footage ingestion, categorization, transcription, cut identification, DaVinci, Suno, rough cut assembly
OperatΩr	Chief Admin Officer	Pipeline state tracking, checklists, breakdown detection, fix prompting, analytics
DistributΩr	Chief Distribution Officer	Content packages, captions, email sequences, approval gates, API posting

Middle Management — Full Module Map

Under Id8Ωr (Ideation)

- IdeaEngine — AI-powered topic generation from trends, VidIQ data, and creator content history
- ScriptΩr — outline and full script generation in creator voice, iterated with VidIQ AI coach
- ResearchΩr — VidIQ Playwright integration, keyword data extraction, competitive analysis
- TreatmentΩr — converts approved script into shoot treatment: scenes, locations, required b-roll list

Under DirectΩr (Production)

- ShotListΩr — generates complete shot list from treatment including dialogue, b-roll, coverage requirements
- ShootDay — day-of dashboard: checklist, shot status, team prompts, real-time coverage tracking
- CoverageΩr — post-shoot analysis: what was captured vs what was required, missing footage alerts
- BriefΩr — generates camera operator and crew briefs from the shot list

Under EditΩr (Post-Production)

- VaultΩr — footage ingestion, AI categorization, searchable database, drag-and-drop intake
- CutΩr — transcript processing, retention cut identification, CTA placement, clip timestamp extraction
- AssemblΩr — DaVinci Resolve API integration, rough cut assembly from approved cut points
- SoundΩr — Suno API integration, mood-matched music generation per scene type
- GraphΩr — infographic and visual asset generation for b-roll replacement and on-screen graphics
- ReviewΩr — creator review interface: watch rough cut, make notes, approve or request changes

Under OperatΩr (Admin)

- PipelineΩr — full pipeline state visualization: every video, every stage, every status
- ChecklistΩr — stage completion tracking, what's done, what's missing, what's blocked
- FixΩr — breakdown detection and AI-powered resolution prompting based on best practices
- AnalyticΩr — performance data aggregation across all platforms, fed back into IdeaEngine

Under DistributΩr (Distribution)

- PackageΩr — M2: content package generation (built, working)
- CaptionΩr — M3: 5-platform clip caption generation (built, working)
- MailΩr — M4: segmented email sequence generation (built, working)
- GateΩr — M1: approval dashboard for all three gates (built, working)
- PostΩr — M5: API posting layer — TikTok, Instagram, Facebook, YouTube, Lemon8
- VaultΩr Link — repurposing engine connecting content library to new distribution cycles

SECTION 3 — THE FULL PIPELINE

Every video moves through this pipeline in order. Stages are sequential but the system is restartable at any point. All data from earlier stages is automatically available to later stages — no copy-pasting, no re-entering information.

Stage	Module	Input	Output	Your Role
M0.1	Id8Ωr / IdeaEngine	Trends, analytics, creator history	Ranked topic list with rationale	Pick a topic
M0.2	Id8Ωr / ResearchΩr	Chosen topic	VidIQ keyword data, competitor analysis	Review research
M0.3	Id8Ωr / ScriptΩr	Topic + research + voice profile	Full script draft in creator voice	Iterate + approve script
M0.4	Id8Ωr / TreatmentΩr	Approved script	Scene breakdown, locations, b-roll list	Confirm treatment
M0.5	DirectΩr / ShotListΩr	Treatment	Complete shot list, crew brief	Review shot list
M0.6	DirectΩr / ShootDay	Shot list	Real-time checklist, team prompts	Shoot the video
M0.7	DirectΩr / CoverageΩr	Footage folder	Coverage report, missing shot alerts	Confirm coverage
M1.0	EditΩr / VaultΩr	Raw footage drop	Categorized, tagged, searchable footage DB	None — automated
M1.1	EditΩr / CutΩr	Transcript + video	Retention cuts, CTA placements, timestamps	Review cut points
M1.2	EditΩr / SoundΩr	Scene list + mood data	Generated music per scene	Approve or swap tracks
M1.3	EditΩr / GraphΩr	Script + cut list	Infographics, on-screen graphics	Approve visuals
M1.4	EditΩr / AssemblΩr	All approved assets	DaVinci Resolve rough cut	Watch, note, approve
M2	DistributΩr / PackageΩr	Video URL + topic	5 content packages (Gate A)	GATE A: Pick 1 package
M3	DistributΩr / CaptionΩr	Approved clips + package	5-platform captions per clip (Gate B)	GATE B: Approve clips
M4	DistributΩr / MailΩr	Video + package + tiers	Full email sequence (Gate C)	GATE C: Approve emails
M5	DistributΩr / PostΩr	Approved content	Live posts across all platforms	None — automated
Ongoing	OperatΩr / AnalyticΩr	Platform performance data	Insights fed to IdeaEngine	Monthly review

SECTION 4 — ID8ΩR: IDEATION MODULE

Purpose

Id8Ωr handles everything before a camera turns on. It takes the creator from ‘I should make a video about something’ to a fully approved script with shot treatment, ready to hand to DirectΩr.

IdeaEngine

The IdeaEngine generates ranked topic suggestions based on three data sources that are automatically combined and weighted:

- VidIQ trending data for the homesteading and off-grid niche (via Playwright browser automation)
- The creator’s content history and performance analytics from AnalyticΩr — what performed well, what angles haven’t been covered, what topics are overdue for a follow-up
- Seasonal logic — root cellar content in autumn, composting in spring, wood stove content in winter. Hardcoded seasonal rules plus AI inference from content history

Each topic suggestion includes: the topic, the recommended content angle (Financial Take / System Is Rigged / Rock Rich / etc.), why now, estimated search volume from VidIQ, and one sentence on the hook approach.

ScriptΩr

ScriptΩr generates a complete video script in the creator’s voice. The process mirrors the existing workflow:

- Creator approves a topic from IdeaEngine output
- ScriptΩr generates a full outline first — hook, story beats, key information, CTA
- Creator reviews outline, adds notes, approves or requests changes
- Full script generated from approved outline
- Script fed to VidIQ AI coach via Playwright for title and keyword iteration
- Creator reviews final script, makes voice adjustments, approves

The script becomes the source of truth for all downstream stages. Every module that follows reads from the approved script.

> **VOICE PROFILE LOCK**
> The creator voice profile (straight-talking, warm, funny, never corporate, slips jokes in to cut tension, mission-driven) is embedded in every ScriptΩr prompt. Scripts are never rewritten without the voice profile. The voice is the product.

ResearchΩr — VidIQ Integration Detail

VidIQ integration uses Playwright browser automation against a logged-in VidIQ session. This avoids API dependency and works with VidIQ’s existing interface.

- Navigate to VidIQ AI Coach in logged-in browser session
- Submit structured prompt: topic, target audience, competitive context

- Extract AI Coach response from DOM
- Parse into structured data: recommended titles, keyword scores, competitive gap analysis
- Feed structured data to IdeaEngine and ScriptΩr as context

Note: VidIQ's clipping tool has been deliberately excluded from the stack. The credit system is not cost-effective ($415 credits for one clip has been observed) and the output quality is insufficient. Clipping is handled entirely by EditΩr / CutΩr using Whisper + Claude + ffmpeg.

SECTION 5 — DIRECTΩR: PRODUCTION MODULE

Purpose

DirectΩr translates an approved script into a complete shoot plan, manages the shoot day in real time, and performs post-shoot coverage analysis. It is the system's production manager.

ShotListΩr

ShotListΩr reads the approved script and treatment and generates a complete, professional shot list. The shot list follows industry-standard structure:

- Scene number and location
- Shot type: dialogue / talking head / b-roll / action / establishing
- B-roll subcategory: wide / medium / close-up / detail / aerial (where applicable)
- Subject and description: what is in frame, what is happening
- Duration estimate
- Priority: hero shot / required / nice-to-have
- Notes: lighting conditions, time of day considerations, equipment needed

The shot list is the foundation of the footage database. Every shot that gets logged in VaultΩr is cross-referenced against the shot list to track coverage completion.

ShootDay Dashboard

The ShootDay dashboard is a mobile-first interface (phone or tablet on location) that gives the crew real-time shot tracking:

- Shot list displayed as a live checklist — tap to mark done
- Coverage percentage per scene shown in real time
- Team prompts generated automatically: 'You still need a close-up of the valve assembly'
- Director notes field per shot — voice-to-text friendly
- End-of-day summary: what was captured, what was missed, CoverageΩr alert if anything critical is absent

> **SHOOT DAY PHILOSOPHY**
> The creator should never have to think about what they need to shoot. The system tells the team. The creator focuses on being present and authentic on camera.

CoverageΩr

Post-shoot, CoverageΩr compares the shot list against the footage that lands in VaultΩr. It identifies:

- Shots confirmed captured (matched by AI vision analysis of footage thumbnails)
- Shots missing: required vs nice-to-have

- Recommended pickup shots if a reshoots is possible
- Edit workarounds if missing shots cannot be reshot — alternative b-roll from Vault, graphics from GraphΩr

SECTION 6 — EDITΩR: POST-PRODUCTION MODULE

Purpose

EditΩr is the largest and most technically complex module. It takes raw footage from a shoot and produces a creator-approved rough cut ready for final polish and upload. It is the system's equivalent of a senior editor and post-production team.

VaultΩr — Footage Intelligence Database

Intake Process

The creator drags a folder of raw footage onto the VaultΩr intake target (a watched folder or drag-and-drop web interface). From that point, the process is fully automated:

- ffprobe (part of ffmpeg) extracts metadata from every file: duration, resolution, codec, file size, creation timestamp
- A thumbnail is extracted from each clip at the 3-second mark using ffmpeg
- Each thumbnail is sent to Claude Vision with a categorization prompt
- Claude returns: shot type, subcategory, content description, quality flag (hero / usable / review / discard)
- All data written to the footage database with full search indexing
- Files optionally reorganized into structured folder hierarchy

Folder Structure

When footage is ingested, VaultΩr creates the following structure:

- YYYY-MM-DD — Project-Name / dialogue / talking-head / b-roll / action / unusable
- B-roll folder further subdivided: wide / medium / close-up / detail
- Each file renamed with descriptive slug: 2026-03-15_root-cellar_broll-wide_003.mp4
- Original filenames preserved in database — nothing is destructive

Search Capabilities

The footage database supports natural language search powered by Claude:

- Category filter: 'Show me all b-roll from March'
- Content search: 'Find clips with the wood stove'
- Technical filter: 'Talking head clips under 60 seconds'
- Project filter: 'Best shots from the root cellar build'
- Usage filter: 'Anything I haven't used in a video yet'
- Cross-reference: 'B-roll that matches the solar panel script'

CutΩr — Transcript-Driven Cut Identification

CutΩr is the module that replaces VidIQ's clipping tool entirely. It uses a three-step process:

- Step 1 — Transcription: Whisper (OpenAI, runs locally, free, private) transcribes the full video with word-level timestamps
- Step 2 — Analysis: Claude reads the full transcript with the approved script and identifies: retention cut points (where viewers drop off based on content structure), CTA placement moments, the 3-5 best short-clip moments with exact timestamps
- Step 3 — Extraction: ffmpeg cuts the identified clips at the exact timestamps. Full resolution, no quality loss, no credit system.

> **WHY THIS IS BETTER THAN OPUS CLIP**
> Whisper + Claude knows your script, your story structure, your CTA goals, and your voice. Opus Clip knows none of that. The clips CutΩr identifies are the right clips for your specific content strategy, not just the highest-energy moments in isolation.

AssemblΩr — DaVinci Resolve Integration

AssemblΩr connects to DaVinci Resolve via its scripting API (Python-based) to automate rough cut assembly:

- Creates a new timeline from the project template
- Drops approved dialogue and talking-head clips in script order
- Inserts b-roll at identified cut points from the shot list
- Adds generated music from SoundΩr to the audio track
- Places generated graphics from GraphΩr at scripted moments
- Exports a rough cut for creator review

The creator's role: watch the rough cut, make notes in ReviewΩr, approve or flag changes. AssemblΩr implements approved changes and re-exports. The creator does not touch the timeline unless they choose to.

SoundΩr — Suno Integration

SoundΩr generates mood-matched music for each scene type using the Suno API (creator has a Pro account):

- Reads the scene breakdown from the treatment: intro, building sequence, emotional moment, CTA, outro
- Generates a Suno prompt for each scene type: tempo, mood, instrumentation, duration
- Calls Suno API, retrieves generated tracks
- Presents options to creator for approval in ReviewΩr
- Approved tracks placed in timeline by AssemblΩr

Music generated is original, royalty-free, and specific to the content. No licensing issues. No searching stock music libraries.

GraphΩr — Infographic Generation

GraphΩr generates on-screen graphics and infographics for moments identified in the script:

- Cost breakdowns — the $340 root cellar total displayed as a clean graphic
- Step-by-step numbered lists for how-to sequences
- Comparison tables — wood stove vs propane, solar ROI math
- Title cards, lower thirds, chapter markers

- Thumbnail concepts rendered as actual image files for creator review

Integration target: Claude’s image generation capabilities + Marblism API (creator has account) for higher-quality visual asset generation.

SECTION 7 — OPERATΩR: ADMIN MODULE

Purpose

OperatΩr is the system's nervous system. It watches every other module, tracks the state of every video in the pipeline, identifies breakdowns before they become problems, and keeps the creator informed without overwhelming them.

PipelineΩr — Master State Dashboard

PipelineΩr is what the creator sees when they open Kre8Ωr. Every video currently in the system is shown as a card with its current stage, what's done, what's next, and what needs the creator's attention. This is the evolved version of M1 (the Approval Dashboard built in the prototype phase).

ChecklistΩr

Every pipeline stage has a defined completion checklist. ChecklistΩr tracks completion per stage per video and prevents a video from advancing to the next stage until all required items are confirmed. This catches problems before they cascade.

FixΩr — Breakdown Intelligence

When ChecklistΩr identifies a missing item or a stage that has stalled beyond its expected timeframe, FixΩr activates:

- Identifies the specific breakdown: what stage, what item, how long stalled
- Generates a resolution prompt based on best practices for that stage
- Presents the creator with a clear 'here's what's wrong and here's how to fix it' card
- Logs the breakdown and resolution for pattern analysis

AnalyticΩr

AnalyticΩr aggregates performance data from all distribution platforms and feeds it back into the system:

- YouTube: views, watch time, retention curve, CTR, search ranking
- TikTok: views, completion rate, shares, follower growth
- Instagram: reach, saves, shares, profile visits
- Facebook: reach, engagement, link clicks
- Lemon8: views, engagement, follower growth
- Email: open rate, click rate, unsubscribes per sequence
- ROCK RICH: new members per video, tier conversion rates

This data feeds directly into IdeaEngine — what worked, what didn't, what topics drive community growth vs raw views. The system learns from every video.

SECTION 8 — DISTRIBUTΩR: DISTRIBUTION MODULE

What's Already Built

The entire DistributΩr module was prototyped during the March 2026 build session. All four tools exist as working HTML files and are functional as standalone local tools. They are M1 through M4 of the build order.

- GateΩr (M1) — Approval Dashboard: three gates (package selection, clip review, community + email approval), active video tracking, scheduled content view, content library with repurpose function, monthly newsletter approval
- PackageΩr (M2) — Content Package Generator: YouTube URL input, angle selection, Claude API generates 5 complete packages (title, hook, rationale, thumbnail concept, YouTube description), session history saved locally
- CaptionΩr (M3) — Clip Caption Generator: clip description input, generates platform-native captions for TikTok, Instagram Reels, Facebook, YouTube Shorts, and Lemon8 simultaneously
- MailΩr (M4) — Email Sequence Generator: Day 0 (everyone), Day 3 and Day 7 (segmented by Kajabi tag: Greenhouse / Garden / Founding 50), Kajabi implementation notes per email

What Gets Built in M5

M5 connects the existing tools to each other and to the external platform APIs, eliminating all manual handoff steps:

- YouTube Data API v3: automatic video detection on upload, metadata pre-fill, scheduling
- TikTok Content Posting API: automated clip upload with approved captions
- Meta Graph API: Instagram Reels and Facebook Page publishing
- YouTube Shorts API: short clip upload pipeline
- Lemon8 API (or Playwright automation if API unavailable): Lemon8 publishing
- Kajabi REST API: community post creation, email sequence scheduling, member tag reading
- Pipeline trigger: YouTube upload detected → PackageΩr fires automatically → packages appear in Gate A

The Three Approval Gates — Full Specification

Gate A — Content Package Selection

Trigger: video uploaded to YouTube (or moved to 'scheduled' status). Input: YouTube video URL + metadata. Output: one selected content package that drives all downstream content.

- 5 packages displayed as cards: title, hook, rationale, thumbnail concept, YouTube description
- Creator selects one, optionally adds a note
- Selected package data written to pipeline database and available to all downstream modules
- Maximum decision time: 2 minutes

Gate B — Clip Queue Review

Trigger: CutΩr completes clip identification. Input: clips with captions per platform. Output: approved clips queued for distribution.

- Each clip shown with timestamp, description, and all 5 platform captions in tabs
- Creator can APPROVE, request CHANGES (with note), or SKIP each clip independently
- Approved clips immediately queued in PostΩr with approved captions
- Maximum decision time: 5 minutes for a full clip batch

Gate C — Community + Email Approval

Trigger: MailΩr and community post generation complete. Input: Kajabi community post draft + full email sequence. Output: approved content queued for Kajabi API.

- Community post shown with full text and copy button
- Day 0, Day 3, Day 7 emails shown with tier tabs (Greenhouse / Garden / Founding 50)
- APPROVE ALL button sends everything or creator can approve individual items
- Kajabi API calls fired on approval: post created, emails scheduled

SECTION 9 — ROCK RICH COMMUNITY INTEGRATION

Community Architecture

ROCK RICH is the creator's Kajabi community. It has three tiers with different content strategies, email logic, and conversion goals:

Tier	Price	Kajabi Tag	Content Strategy
The Greenhouse 🌱	Free	greenhouse	Value-first. Every touchpoint makes The Garden feel like the obvious next step. Never second-class, always moving toward more.
The Garden 🌿	$19/month	garden	Depth and exclusivity. Behind-the-scenes, deeper insights, community engagement, live Q&As. Reward the investment.
The Founding 50 🏆	$297 one-time	founding-50	Inner circle. Early access, direct creator contact energy, insider updates, first to know everything. Make them feel it.

Email Strategy Rules

- Day 0: one email to all members — new video announcement, get them to watch, warm and personal not newsletter-blast
- Day 3 Greenhouse: value-add related to video topic + natural nudge toward The Garden
- Day 3 Garden: deeper context or behind-the-scenes — reward paid status
- Day 3 Founding 50: personal note energy, inner circle acknowledgment, exclusive content
- Day 7 Greenhouse: the soft pitch — video as proof of The Garden value, invitation feels like a friend not a funnel
- Day 7 Garden: next video tease, community engagement prompt, reinforce they're in the right place
- Day 7 Founding 50: full insider update — what's coming, what they get first, direct creator energy

Conversion Architecture

Every piece of content in the system has a conversion purpose: watch the video, or enter the Greenhouse. Every email has a conversion purpose: watch the video, or upgrade tier. This is not accidental. It is designed into every prompt and every template.

> **THE FUNNEL RULE**
> All marketing either points back to a video or flows into the Greenhouse free tier. The Greenhouse converts to The Garden. The Garden is the sustainable revenue base. The

> Founding 50 is the inner circle that makes everything feel real. Every automation decision must serve this architecture.

SECTION 10 — EXISTING AGENT INTEGRATIONS

What the Creator Already Has Running

Before Kre8Ωr was built, the creator had established a set of external agents and tools. These are documented here so the Kre8Ωr system integrates with them rather than duplicating or conflicting:

- Blog writing agent — currently active, writes and posts blog content
- Facebook and Instagram posting agent — currently active, posts to social platforms
- Email drafting agent — currently active, drafts email content
- Marblism — image generation platform, creator has active account (integrate with GraphΩr for thumbnail and graphic generation)
- Suno — AI music generation, creator has Pro account (primary integration for SoundΩr)
- VidIQ — keyword research and AI coach (ResearchΩr integration via Playwright)
- Canva — creator has account, existing thumbnail templates (GraphΩr can trigger Canva API for template-based thumbnail generation)
- Content365 — one-time fee paid, content calendar scheduling
- Kajabi — active subscription, community and email platform (MailΩr + Gate C integration)

Integration Principle

Kre8Ωr does not replace existing agents that are working. It coordinates them. Where an existing agent does something well, Kre8Ωr feeds it the right inputs and reads its outputs. Where an existing agent is redundant with a Kre8Ωr module, the module wins because it has full pipeline context that the standalone agent does not.

The Facebook and Instagram posting agent will be superseded by PostΩr in M5 — not because it doesn't work, but because PostΩr will post with the approved captions from CaptionΩr automatically, with no manual step in between.

SECTION 11 — DATABASE & DATA FLOW

Database Architecture

Kre8Ωr uses SQLite for the personal instance. When productized for multiple creators, this migrates to PostgreSQL with no schema changes. The database is the central nervous system — every module reads from and writes to it.

Core Tables

- projects — one row per video: id, title, topic, status, current_stage, created_at, published_at
- scripts — outline, full script, approved version, iteration history, per project
- shots — shot list per project: shot_id, type, subcategory, description, priority, captured (boolean)
- footage — every clip in the vault: file_path, project_id, shot_type, subcategory, description, duration, resolution, thumbnail_path, quality_flag, used_in (array of project_ids)
- cuts — identified clip moments: project_id, start_timestamp, end_timestamp, type (retention/CTA/social), approved
- packages — the 5 generated content packages per project, selected package flagged
- captions — per clip, per platform: clip_id, platform, caption_text, approved
- emails — per project, per day, per tier: subject, body, approved, sent_at
- posts — scheduled and sent social posts: platform, content, scheduled_at, posted_at, post_id
- analytics — performance data per post and per project, pulled from platform APIs
- pipeline_state — current stage and status for every active project

Data Flow Between Stages

No module requires the creator to re-enter information that already exists in the database. The data flows forward automatically:

- Script approved → voice, angle, key messages available to all downstream modules
- Shot list approved → CoverageΩr knows what to look for in ingested footage
- Package selected in Gate A → title, hook, angle, description available to CaptionΩr and MailΩr
- Clips approved in Gate B → PostΩr knows exactly what to upload and where
- Emails approved in Gate C → Kajabi API called automatically with correct tier segmentation
- Analytics data → feeds IdeaEngine for next video cycle

> **THE NO-PASTE RULE**
> If a creator has to copy text from one tool and paste it into another, that is a system failure. Every handoff between modules must be data-driven through the shared database. By M5, there is zero manual data transfer anywhere in the pipeline.

SECTION 12 — BUILD ORDER

What's Already Built (Prototype Phase — March 2026)

The following exist as working standalone HTML files and are production-ready for manual use:

- M1 — GateΩr / Approval Dashboard (kre8r-approval-dashboard.html)
- M2 — PackageΩr / Content Package Generator (kre8r-m2-package-generator.html)
- M3 — CaptionΩr / Clip Caption Generator (kre8r-m3-caption-generator.html)
- M4 — MailΩr / Email Sequence Generator (kre8r-m4-email-generator.html)

Claude Code Migration (Phase 1)

The first Claude Code session should establish the project foundation and migrate the prototype tools into a proper codebase:

- Initialize Node.js project with SQLite database
- Set up creator-profile.json with 7 Kin Homestead configuration
- Migrate M1-M4 HTML tools into a unified local web app (Express.js server)
- Connect all four tools through the shared database — no more copy-paste between them
- Build PipelineΩr state tracker as the home screen
- Implement local file watcher for footage intake (VaultΩr foundation)

Phase 2 — EditΩr Build

- VaultΩr: drag-and-drop footage intake, ffprobe metadata extraction, Claude Vision categorization, search interface
- CutΩr: Whisper transcription integration, Claude cut identification, ffmpeg clip extraction
- SoundΩr: Suno API integration, scene-based music generation, approval interface
- GraphΩr: infographic generation, Marblism API integration, thumbnail rendering
- AssemblΩr: DaVinci Resolve Python API integration, rough cut automation
- ReviewΩr: creator review interface for rough cut approval

Phase 3 — Id8Ωr + DirectΩr Build

- IdeaEngine: topic generation from analytics + VidIQ data + seasonal logic
- ScriptΩr: full script generation in creator voice, outline-first workflow
- ResearchΩr: VidIQ Playwright automation, structured data extraction
- ShotListΩr: shot list generation from approved script
- ShootDay: mobile-first shoot day dashboard
- CoverageΩr: post-shoot coverage analysis

Phase 4 — M5 Automation Layer

- YouTube Data API v3: upload detection, metadata, scheduling

- TikTok Content Posting API: clip upload automation
- Meta Graph API: Instagram Reels and Facebook publishing
- Lemon8: API or Playwright automation
- Kajabi REST API: community posts and email scheduling
- Pipeline triggers: YouTube upload → PackageΩr fires automatically
- Full end-to-end test: idea to distribution with zero manual steps

Phase 5 — OperatΩr + Intelligence Layer

- AnalyticΩr: platform API data aggregation
- FixΩr: breakdown detection and resolution prompting
- IdeaEngine feedback loop: analytics → topic recommendations
- Repurposing engine: vault content surfaced for new distribution cycles
- Voice agent layer (Computer): ElevenLabs + Whisper wake word detection

SECTION 13 — COMMERCIAL LAYER

The Personal-to-Product Path

The personal 7 Kin Homestead instance of Kre8Ωr is simultaneously the proof of concept, the battle-tested prototype, and the founding case study for a commercial product. The architecture was designed from day one for this transition.

The difference between the personal tool and a commercial SaaS product is one configuration file: creator-profile.json. The engine never changes. Only the config does.

The Product Suite

Product 1 — Kre8Ωr (Full OS)

The complete content pipeline for solo creators. Research → scripting → shoot planning → footage management → post-production → distribution → email → community. Everything.

- Target: solo creators, 10k-500k followers, any niche, 2-8 videos per month
- Revenue model: monthly subscription SaaS
- Differentiator: the only tool that does the thinking, not just the scheduling
- Proof of concept: 7 Kin Homestead personal instance, built and battle-tested by the founder

Product 2 — EditΩr (Standalone)

The footage intelligence and post-production module as a standalone product. Any videographer, any creator, any production house.

- Target: videographers, wedding and event shooters, small production teams
- Core value: drag, drop, search. Find any shot you’ve ever taken in seconds.
- Revenue model: one-time purchase or subscription

Product 3 — DistributΩr (Standalone)

The distribution and content strategy module as a standalone tool. For creators who have their production handled but need the distribution layer automated.

- Target: creators with existing editing workflows who want the admin layer eliminated
- Core value: video in, multi-platform content out, one approval

Commercialization Checklist

Before any instance of this system is commercialized, the following must be true:

- All creator-specific data is in creator-profile.json, not hardcoded anywhere
- The onboarding flow creates a new creator-profile.json from a setup wizard
- API keys are stored per-creator in an encrypted credentials store
- The voice profile input is a structured setup process, not a hardcoded string
- Multi-tenant database architecture supports multiple creator instances
- The 7 Kin Homestead instance is the demo instance, showcasing the full system in a real niche

SECTION 14 — FULL INTEGRATION REFERENCE

Tool	Module	Role	Integration Method	Status
Claude API	All modules	AI brain — writing, generation, vision, analysis	Anthropic API direct — claude-sonnet-4-20250514	Built
Whisper	CutΩr	Local video transcription with word timestamps	OpenAI Whisper, runs locally, free	M5
ffmpeg	CutΩr, VaultΩr	Video processing, clip extraction, thumbnail generation	Local CLI, already in stack	M5
ffprobe	VaultΩr	Metadata extraction from footage files	Part of ffmpeg package	M5
DaVinci Resolve	AssemblΩr	Rough cut assembly, timeline automation	DaVinci Python scripting API	Phase 2
Suno API	SoundΩr	AI music generation per scene type	Suno API — creator has Pro account	Phase 2
Marblism	GraphΩr	High-quality image and graphic generation	Marblism API — creator has account	Phase 2
VidIQ	ResearchΩr	Keyword data, AI coach, competitor analysis	Playwright browser automation (logged-in session)	Phase 3
YouTube API v3	DistributΩr	Upload detection, metadata, scheduling, pinned comments	YouTube Data API v3	M5
TikTok API	PostΩr	Clip upload and scheduling	TikTok Content Posting API (approval required)	M5
Meta Graph API	PostΩr	Instagram Reels + Facebook Page publishing	Meta Graph API — Reels endpoint	M5
Lemon8	PostΩr	Lemon8 publishing (80k followers, untapped)	API if available, Playwright fallback	M5
Kajabi API	MailΩr, Gate C	Community posts, email scheduling, member tags	Kajabi REST API	M5
Canva API	GraphΩr	Thumbnail generation from existing templates	Canva API — creator has account	Phase 2
ElevenLabs	SoundΩr (Computer)	Voice synthesis for Computer voice agent	ElevenLabs API — future feature	Future

SQLite	OperatΩr	Local pipeline state and content database	Node.js better-sqlite3 package	Phase 1
Playwright	ResearchΩr, PostΩr	Browser automation for VidIQ and platform fallbacks	Node.js Playwright package	Phase 3
Tailscale	All	Secure remote access to local dashboard from phone	Tailscale free tier	Phase 1
Bitwarden	All	Secure storage of all API keys and credentials	Bitwarden — already in stack	Now

SECTION 15 — CLAUDE CODE HANDOFF BRIEF

How to Start a Claude Code Session for This Project

Drop this document and all four prototype HTML files into a Claude Code session and open with the following:

> **CLAUDE CODE OPENING PROMPT**
> I am building Kre8Ωr — a complete AI-native content production OS for solo creators. The Master System Bible (attached) contains the full architecture. Four prototype tools are also attached (M1-M4 HTML files). Your first job is to: (1) read the bible completely, (2) initialize a Node.js project with the structure described in Section 12 Phase 1, (3) create creator-profile.json for the 7 Kin Homestead instance, (4) set up the SQLite database with the schema from Section 11, (5) migrate the four prototype tools into a unified Express.js app connected to the database. Ask me nothing about intent — it is all in the bible. Ask me only about credentials and local paths.

Files to Include in the Claude Code Project

- This document — Kre8Ωr Master System Bible v1.0
- kre8r-approval-dashboard.html — M1 prototype
- kre8r-m2-package-generator.html — M2 prototype
- kre8r-m3-caption-generator.html — M3 prototype
- kre8r-m4-email-generator.html — M4 prototype
- 7-Kin-Content-OS-Architecture.docx — original architecture document
- 7-Kin-Content-OS-Battle-Plan.docx — hardware and subscriptions reference
- 7-Kin-Content-OS-Commercial-Strategy.docx — commercial layer reference
- 7-Kin-Workflow-Playbook-LIGHT.docx — workflow reference

Creator Context for Claude Code

Include the following context in the Claude Code session so the system is calibrated correctly from the start:

- Creator: 7 Kin Homestead — off-grid living and homesteading, 725k TikTok, 54k YouTube, 80k Lemon8
- Community: ROCK RICH on Kajabi — Greenhouse (free), The Garden ($19/mo), Founding 50 ($297 one-time)
- Voice: straight-talking, warm, funny, ‘most unserious serious person to ever make a video’, mission-driven, never corporate
- Primary content angles: Financial Take (ROI, real numbers), System Is Rigged (opt out and win), Rock Rich Episode (doing a lot with a little)
- Existing agents: blog writer, FB/IG poster, email drafter — do not replace, coordinate
- Existing tools: Suno Pro, Marblism, VidIQ, Canva, Kajabi, Content365 — integrate don’t duplicate

- Hardware path: local machine first, DigitalOcean Droplet when stable
- Build order: follow Section 12 exactly — Phase 1 first, prove it works, then Phase 2
